Winking

With 24 FPS :

22 Frames | 2 Frames

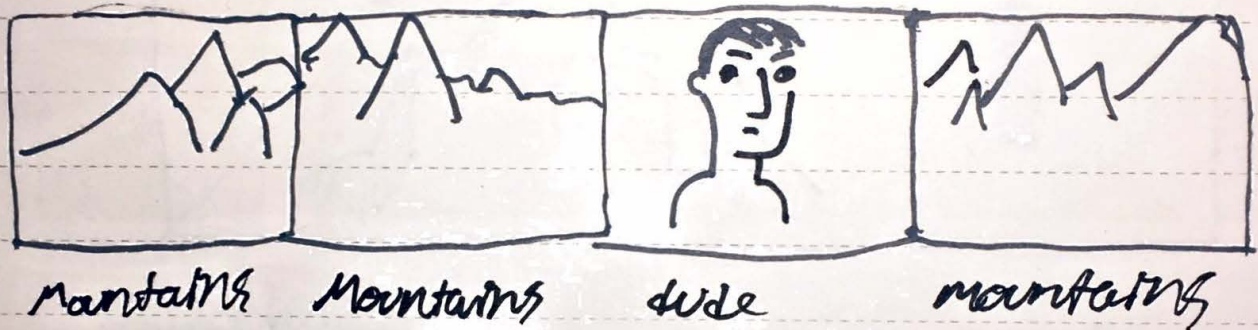

2 Frames | 22 Frames

I feel the change over time effect and the fact that both images will be divided by the alternate will create an interesting spectrum between A and B states.

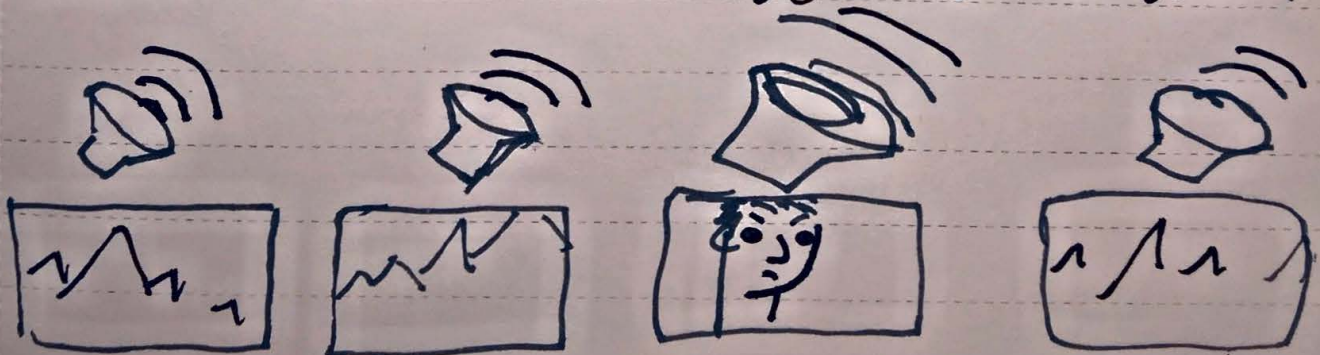

"Odd one out"

Based on the 'Oddball' effect in which ⁱⁿ a string of similar photos played for identical amounts of time, an outcast photo will feel as though it is played longer.

Interrupted repetition feels longer because more focus is placed on it

I began wondering if a particular sound is repeated while these images are played, will the sound also feel longer? If so, will the sound sound lower in tone as well?
